Homework 01

13th September, 2025 – Professor Shuja Ur Rehman Baig

Instructions:

- Student strictly must not copy code from anywhere.
- Push your code on github classroom before deadline (Classroom will be shared later with you all).
- Viva of each homework will be conducted.
- **Deadline:** 19th September, 2025

Problem Statement

Design a simple **C# console application** to maintain student records using **files**.

Each student record should include:

- **Id** (int)
- **Name** (string)
- **Age** (int)
- **Department** (string)

You must use **classes, properties (getter/setter), constructors, and file streams**.

Requirements

1. Create a **Student** class
 - Fields: **Id**, **Name**, **Age**, **Department**
 - Use **getter/setter** properties.
 - Create a **constructor** to initialize values.
 - Allow **object initializer** syntax as well.

2. Input and Output

- Allow the user to enter multiple student records from the console.
- Save each student record into a file (`students.txt`) using **FileStream** with **FileMode.Append**.

Each record should be written in the format:

`Id, Name, Age, Department`

3. Display Records

- Read all records back from the file using **FileStream** with **FileMode.Open**.
- Print them neatly on the console.

4. Menu-driven program

User should see:

1. Add Student
2. View Student
3. Exit
